

Section 1 - We think the next decade of agents will look more like people. Embodied, real-time agents that watch you and act alongside you. Building this requires solving low-latency avatar rendering, persistent multi-modal context and reliable computer use; at Void, we have cracked all three.

Section 2 - Recently, we shipped an alien field observer that can see, talk and act on macOS

Section 3 - Right now, we are working on persona libraries for specific verticals such as healthcare, education, and food.

THE TEAM - I came to the United States on a scholarship to study computer science. The expected path, for someone from where I come from, was to get the degree, get the job, and stay quiet. The work that interested me was somewhere else.

I learned to write before I learned to ship. Years of essays, arguments and poetry taught me how to take something dense and make it land, a skill I'd later realise is the most undervalued one in software. AI products live or die on how well their makers can articulate what they are; this knowledge requires a deep understanding of the model ecosystem and how models work together.

The first thing I tried to build was a personal AI tutor to help me study. The second was a voice agent with low enough latency to feel like it was real-time. Both failed. But the lesson was that I'd been building before I'd done the research.

After that, every project started with a longer read. Voice agents, hackathon projects, SkiYu — the skill marketplace I just shipped — each got sharper because failures became more specific.

Then I built Zek'thar. And the thing that hit me halfway through was bigger than the project: **we already have the tools to build AGI. What we don't have are the tools to put them together.** That gap is the thesis.

Void Labs is the lab built around that thesis. We're starting with real-time AI personas — characters that see your screen, talk with you, and act alongside you. Zek'thar is the first.

Inside me, there's a kid from the same place I was who hasn't yet been told that the path can be drawn differently. If we build well, they'll see it.
